1.0 Introduction
Nasal Expiratory Positive Airway Pressure (EPAP) [Provent® Therapy] is a novel device for the treatment of obstructive sleep apnea (OSA). The effectiveness of nasal EPAP has been validated through multiple clinical trials demonstrating statistically significant and clinically meaningful reductions in apnea-hypopnea index, oxygen desaturation and daytime sleepiness.¹,²,³,⁴,⁵

This document is intended to provide prescribing physicians with suggested guidelines for patient selection, acclimation support and efficacy verification when using nasal EPAP for the treatment of OSA.

It is recommended that new prescribers of nasal EPAP follow these guidelines to systematically capture and analyze data from a minimum of 10 patients to help document nasal EPAP effectiveness within their practice.

2.0 Methods
The practice parameters outlined below are based on published nasal EPAP clinical literature and best practices from high volume physician prescribers of nasal EPAP therapy in the United States.

While these parameters outline a recommended clinical practice protocol for nasal EPAP, the physician is best suited to determine how and whom to prescribe EPAP, given individual patient history, symptoms and expected follow up care.

Figure 1 summarizes a suggested pathway for patients under consideration for treatment with nasal EPAP therapy. More detailed recommendations are provided in Section 3.0.
Figure 1. Suggested Nasal EPAP Practice Parameters

Baseline Evaluation and Diagnosis
PSG or portable recording plus clinical signs and symptoms

Data capture in the medical records to include AHI (supine and non-supine), ODI, ESS

Patient Selection
Minimally compliant or unwilling to use CPAP
Newly diagnosed mild to moderate OSA
Seeking CPAP alternative during travel/no electricity

Initial Therapy Acceptance
Device use training and coaching at office visit
Patients receive 10-night sample for in-home acclimation/evaluation
Outbound call(s) for acclimation support. Call every other day for first 10 days as required until acclimation achieved

Data capture in the medical records to include AHI (supine and non-supine), ODI, ESS, compliance

Effectiveness Confirmation
Patients that acclimate return for therapeutic benefit assessment via PSG or portable recording

May use adjunctive therapy to augment efficacy (e.g. chin strap, positional therapy)

Prescription
Patients with demonstrated efficacy given prescription

Follow-up
Patient follow up to evaluate OSA symptoms and adherence with therapy

Data capture in the medical records to include ESS, compliance
3.0 Recommendations

3.1 Diagnosis and Baseline Evaluation
Newly diagnosed patients or those with a prior OSA diagnosis (within the past 12 months) may be considered for this protocol. The Berlin Questionnaire (Appendix A) may be useful as a screening tool to identify patients at risk for sleep apnea.6

Either in-laboratory polysomnography (PSG)7 or portable recording8 are recommended to confirm the diagnosis of OSA9. Both modalities provide objective results (AHI, ODI) that can be compared to results following the initiation of nasal EPAP treatment. Use of in-laboratory PSG or portable recording is of particular importance when a foundational data set is being established to support nasal EPAP as a new OSA therapeutic option within a clinical practice.

The following data should be collected at baseline:
- Apnea Hypopnea Index (supine and non-supine)
- Oxygen Desaturation Index
- Epworth Sleepiness Scale (ESS)

Sample ESS data collection forms are provided in Appendix B and a sample data collection spreadsheet is provided as Appendix C.

3.2 Patient Selection
Provent Therapy is indicated for the treatment of obstructive sleep apnea (OSA). The Provent instructions for use (IFU) should be consulted for a complete list of contraindications, warnings, precautions and possible adverse events (reference the current IFU supplied with the product).

Physicians in clinical practice have prescribed nasal EPAP to the following patients:
- Those who have refused CPAP or have tried CPAP and given up
- Those who are using CPAP, but not all night, every night
- Patients newly diagnosed with mild to moderate OSA
- Patients who use CPAP but need an alternative therapy for occasional travel or when electricity is not available

At this time, there is no data to predict which patients will be most effectively treated with nasal EPAP based on specific patient characteristics.
3.3 Initial Therapy Acceptance
A ten night trial of nasal EPAP in the home is recommended to evaluate the patient’s initial ability to acclimate to the therapy. Prior to use, a trained practitioner or designee should instruct and allow each patient to apply the nasal EPAP devices. A patient education brochure can be used to guide this training discussion (reference LBL0227-01). It is also essential to ensure that patients have realistic expectations regarding the possible initial discomfort of nasal expiratory resistance and be informed that it may take up to one week or longer to acclimate to the therapy. Outbound calls to patients should be made every other day during the first 10 day trial of nasal EPAP until acclimation is achieved.

3.4 Effectiveness Confirmation
Patients that are able to acclimate to nasal EPAP during the 10 night trial period should undergo an assessment of effectiveness to ensure a satisfactory therapeutic benefit. It is suggested that the same methodology used for OSA diagnosis be used for effectiveness verification. As noted in section 3.1, these verification methods include in-lab PSG or portable recording to obtain objective results. The same variables evaluated at baseline should be evaluated again for comparison [AHI (supine and non-supine), ODI, ESS].

Anecdotal evidence from practicing physicians suggests that adjunctive therapy such as the use of positional therapy or chin straps may augment effectiveness of nasal EPAP.

3.4 Prescription and Device Use
Patients with demonstrated efficacy may be given a prescription for nasal EPAP by a licensed health care practitioner. Nasal EPAP devices are intended for a single night of use and should be discarded after wearing. Patients may use nasal EPAP as first line therapy or some may opt to continue with CPAP as a primary therapy and use nasal EPAP for travel or when there is no electricity available.

3.5 Follow-up
Patients should be scheduled for periodic follow-up office visits to assess patient compliance with nasal EPAP as well as to evaluate signs and symptoms of OSA. In particular, the physician should ask about device use (compliance) and use ESS to evaluate daytime sleepiness.

3.6 Other Considerations
Patients that fall outside of the selection criteria above, including patients who may refuse to undergo diagnostic testing (and are at high risk for OSA) or who may refuse follow-up consultation, may be considered for empiric evaluation with nasal EPAP because they are unlikely to otherwise be diagnosed or accept alternative therapies.
4.0 Conclusions
These guidelines were developed based on the current nasal EPAP clinical literature and with feedback from practicing physicians in the United States with significant clinical practice experience with nasal EPAP. Patient selection and effectiveness assessment with nasal EPAP are ultimately at the discretion of the prescribing physician.

Berlin Questionnaire (for sleep apnea)

Scoring Berlin questionnaire

The questionnaire consists of 3 categories related to the risk of having sleep apnea. Patients can be classified into High Risk or Low Risk based on their responses to the individual items and their overall scores in the symptom categories.

Categories and scoring:

Category 1: items 1, 2, 3, 4, 5.

Item 1: if ‘Yes’, assign 1 point
Item 2: if ‘c’ or ‘d’ is the response, assign 1 point
Item 3: if ‘a’ or ‘b’ is the response, assign 1 point
Item 4: if ‘a’ is the response, assign 1 point
Item 5: if ‘a’ or ‘b’ is the response, assign 2 points

Add points. Category 1 is positive if the total score is 2 or more points

Category 2: items 6, 7, 8 (item 9 should be noted separately).

Item 6: if ‘a’ or ‘b’ is the response, assign 1 point
Item 7: if ‘a’ or ‘b’ is the response, assign 1 point
Item 8: if ‘a’ is the response, assign 1 point

Add points. Category 2 is positive if the total score is 2 or more points

Category 3 is positive if the answer to item 10 is ‘Yes’ OR if the BMI of the patient is greater than 30kg/m².

(BMI must be calculated. BMI is defined as weight (kg) divided by height (m) squared, i.e., kg/m²).

High Risk: if there are 2 or more Categories where the score is positive

Low Risk: if there is only 1 or no Categories where the score is positive
Additional question: item 9 should be noted separately.
BERLIN QUESTIONNAIRE

Height (m) ________  Weight (kg) ________  Age ________  Male / Female

Please choose the correct response to each question.

**CATEGORY 1**

1. **Do you snore?**
   □ a. Yes  
   □ b. No  
   □ c. Don’t know

*If you snore:*

2. **Your snoring is:**
   □ a. Slightly louder than breathing  
   □ b. As loud as talking  
   □ c. Louder than talking  
   □ d. Very loud – can be heard in adjacent rooms

3. **How often do you snore**
   □ a. Nearly every day  
   □ b. 3-4 times a week  
   □ c. 1-2 times a week  
   □ d. 1-2 times a month  
   □ e. Never or nearly never

4. **Has your snoring ever bothered other people?**
   □ a. Yes  
   □ b. No  
   □ c. Don’t Know

5. **Has anyone noticed that you quit breathing during your sleep?**
   □ a. Nearly every day  
   □ b. 3-4 times a week  
   □ c. 1-2 times a week  
   □ d. 1-2 times a month  
   □ e. Never or nearly never

**CATEGORY 2**

6. **How often do you feel tired or fatigued after your sleep?**
   □ a. Nearly every day  
   □ b. 3-4 times a week  
   □ c. 1-2 times a week  
   □ d. 1-2 times a month  
   □ e. Never or nearly never

7. **During your waking time, do you feel tired, fatigued or not up to par?**
   □ a. Nearly every day  
   □ b. 3-4 times a week  
   □ c. 1-2 times a week  
   □ d. 1-2 times a month  
   □ e. Never or nearly never

8. **Have you ever nodded off or fallen asleep while driving a vehicle?**
   □ a. Yes  
   □ b. No

*If yes:*

9. **How often does this occur?**
   □ a. Nearly every day  
   □ b. 3-4 times a week  
   □ c. 1-2 times a week  
   □ d. 1-2 times a month  
   □ e. Never or nearly never

**CATEGORY 3**

10. **Do you have high blood pressure?**
    □ Yes  
    □ No  
    □ Don’t know

Please select one category that best describes the patient’s frequency of Provent device use:

- Regular user: >5 nights per week
- Frequent user: 1-4 nights per week
- Occasional user: <3 nights per month

### COMBINATION THERAPY

On the nights when the patient is using Provent, are any other therapies used in combination with Provent?

- No
- Yes

If yes, check all that apply

- Positional Therapy (e.g., ball in back, pillow, sleep position)
- Oral Appliance
- Chin Strap
- Other, please specify:
